

## **2017-19 Ski doo G4 Motor Mount Shims**

### **Clutch Side Shims:**

- The clutch side shims are the larger round shims in the kit. If shimming the front motor mount place the shim under the aluminum standoff against the bottom motor mount.
- If shimming the rear motor mount place the shim above the aluminum standoff against the top motor mount.
- Refer to the service manual for instructions on how to remove the motor mount bolts to add the shims.

### **Mag Side Shims:**

- The mag side shim is the small shim with the tab on the side. The tab is there to help with inserting and removing the shim. This shim goes between the aluminum motor mount and motor mount itself. Loosen the motor mount bolt approximately 1/8", take a pry bar and pry the motor up and slide in the shim. Torque the motor mount bolt to 18 +/-3 ft-lb.
